

# Package ‘zernike’

June 3, 2023

**Title** Zernike Polynomials

**Version** 3.7.6

**Author** M.L. Peck <mpeck1@ix.netcom.com>

**Depends** R (>= 4.1.0)

**Suggests** rgl, robustbase, clue, data.table, dplyr, pixmap, mvtnorm

**Imports** Rcpp (>= 1.0.0), RcppParallel

**LinkingTo** Rcpp, RcppArmadillo, RcppParallel, BH

**Description** Routines for Manipulation of Zernike polynomials and  
Interferogram fringe analysis

**Maintainer** M.L. Peck <mlpeck54@gmail.com>

**License** MIT, GPL, and BSD

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.1.2

<i>addfit</i>	<i>Separate wavefronts</i>
---------------	----------------------------

---

**Description**

Separate a set of wavefronts measured at different orientations into "polished in" and instrumental or "test stand" components.

**Usage**

```

addfit(..., th = 0, zcm = NULL, theta = numeric(0))

separate.wf(
  zcm,
  theta,
  maxorder = 14,
  nrow = nrow.default,
  ncol = ncol.default,
  cp = cp.default
)
```

**Arguments**

<code>...</code>	one or more wavefront fits as returned by <a href="#">psifit</a> , <a href="#">vortexfit</a> , <a href="#">fftfrit</a> , or <a href="#">wf_net</a> .
<code>th</code>	the orientation angle(s) of object under test, in degrees.
<code>zcm</code>	Zernike coefficient matrix from the <code>zcoef.net</code> entry in the wavefront fits, minus the first 3 elements.
<code>theta</code>	vector of angles from <code>addfit</code> .
<code>maxorder</code>	the maximum Zernike polynomial order of the fits.
<code>nrow</code>	number of rows in the reconstructed wavefronts.
<code>ncol</code>	number of columns in the reconstructed wavefronts.
<code>cp</code>	list of values describing the location and size of the wavefront as returned by <a href="#">circle.pars</a> or <a href="#">pupil.pars</a> .
<code>zcb</code>	a data frame with zernike coefficients and standard errors of estimates for intrinsic and instrumental aberrations.
<code>sumstats</code>	a data frame with summary statistics describing the fits to each set of coefficients.
<code>wf.mirror</code>	the estimated derotated wavefront, stored in a matrix of size <code>nrow</code> x <code>ncol</code> with class <code>pupil</code> .

## Details

The two functions `addfit()` and `separate.wf()` work together to provide a rudimentary project management capability when multiple optical tests have been run on an optical system rotated to one or more orientations. All `addfit()` does is extract the net Zernike coefficients in the list of values returned by `psifit`, `vortexfit`, `fftfit`, or `wf_net`. It also accepts one or more orientation angles in degrees.

The odd parameter list is to provide some flexibility in data entry. For example if several fits are available they could be entered as a group with the `thetas` entered as a vector the same length as the number of fits. Alternately fits could be entered one at a time. If the latter strategy is followed be sure to recycle the variable name that the return is assigned to. Also, the Zernike polynomial fits should be made to the same polynomial order. This isn't checked and will surely cause an error if different fit orders are used.

`separate.wf()` makes use of the properties of Zernike polynomials under rotations to disentangle the contributions from the "mirror" and the instrument or test stand to the extent possible. Least squares fits are performed for each non-axysmmetric aberration and some possibly useful summary statistics from the fits are returned in the data frames `zcb` and `sumstats`.

## Functions

- `addfit`: Add a wavefront fit to tracking list
- `separate.wf`: Separate wavefronts

---

aiapsi

---

*Iterative algorithms for PSI with unknown phase shifts*

---

## Description

Three iterative algorithms for PSI with unknown phase shifts.

## Usage

```
aiapsi(im.mat, phases, ptol = 0.001, maxiter=20, trace=1)
aiapsiC(im.mat, phases_init, ptol, maxiter, trace)
hkpsi(im.mat, phases, maxiter = 20, ptol = 0.001,
      trace = 1, plotprogress = TRUE)
tiltpsi(im.mat, phases, coords, ptol = 0.01, maxiter = 20, trace = 1)
tiltpsiC(im.mat, phases, coords, ptol, maxiter, trace)
```

## Arguments

<code>im.mat</code>	a <i>matrix</i> of interferogram values
<code>phases</code>	Starting guess for phase shifts
<code>ptol</code>	Convergence criterion for phase shifts
<code>maxiter</code>	Maximum number of iterations
<code>trace</code>	Boolean: Print some summary data at each iteration.

plotprogress	Plot some summary data for each iteration? Also, for tiltpsi and tiltpsiC
coords	Low order Zernike polynomial matrix

### Details

The “variable tilt” algorithm now allows an indefinite number of low order Zernike terms to be variable between phase steps. coords can be created with [zpm](#) setting maxorder to a small value, say 4, discarding the first (dc) column and retaining as many as desired. There must be at least two columns for tilts. The third will be defocus, the next two astigmatism, the next two primary coma, ...

aiapsi and tiltpsi are wrappers for the calls to the C++ code in aiapsiC and tiltpsiC with sensible defaults for ptol, maxiter, and trace.

### Value

A list containing the following elements:

phi	The wrapped phase estimate. This is a vector as long as the number of rows in im.mat.
mod	Modulation estimate.
phases	Phase shift estimates.
iter	Number of iterations.
sse	Sum squared error at each iteration.

Also, for tiltpsi

zcs	Matrix of Zernike coefficients, with one row for each column in coords and number of columns = number of columns of im.mat.
-----	---

astig.bath

*Zernike coefficients for astigmatism due to Bath geometry.*

---

### Description

Calculates Bath astigmatism coefficients with optional rotation of phi degrees.

### Usage

```
astig.bath(D, rc, s, lambda = 632.8, phi = 0)
```

### Arguments

D	Diameter
rc	Radius of curvature
s	separation of reference and test beams
lambda	Wavelength
phi	angle of image horizontal relative to interferometer axis, in degrees

### Details

D, rc, s, must have the same units. If those units are mm the source wavelength lambda should be in nm.

### Value

The Zernike coefficients for primary astigmatism terms.

### Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

---

brcutpuw

*Branch cut algorithm for phase unwrapping*

---

### Description

Solves a modification of the assignment problem to minimize the total length of branch cuts.

### Usage

```
brcutpuw(phase, pen = 0, details = FALSE)
```

**Arguments**

phase	Matrix containing the wrapped phase map
pen	Optional penalty value for connecting a residue to an edge
details	boolean: if TRUE return some extra details for diagnostics

**Value**

A matrix containing the unwrapped wavefront. If details==TRUE a named list starting with the unwrapped wavefront in puw.

**Author(s)**

M.L. Peck

**See Also**

[qpuw idiffpuw](#)

**Examples**

```
set.seed(1234)
PW <- wrap(matrix((0:100)*pi/10,101,101))
## need a border of NA's
PW <- cbind(rep(NA,101), PW, rep(NA,101))
PW <- rbind(rep(NA,103), PW, rep(NA,103))
PW <- PW + rnorm(103^2)
mtext(rmap(PW, plot=TRUE))
PU <- brcutpuw(PW, details=TRUE)
image(1:103, 1:103, PU$bcuts, col="blue", add=TRUE)
X11()
image(PU$puw, col=grey256, asp=1, useRaster=TRUE)
```

---

circle.hough

*Estimate parameters of a circle using Hough Circle Transform*

---

**Description**

Uses a portion of the canny algorithm to find candidate edge points and the direction of the gradient at those points, then uses Hough Circle Transform to estimate circle parameters.

**Usage**

```
circle.hough(
  im,
  fw = 2,
  qt = 0.995,
  excl = 5,
  rmin = min(dim(im))/4,
```

```

    rmax = min(dim(im))/2,
    rstep = 1,
    dtheta_max = 0.5,
    dtheta_step = 0.05,
    nn = 7,
    plots = TRUE,
    details = FALSE
)

```

### Arguments

im	The image to find a circle in (a modulation estimate is best)
fw	Size of Gaussian blur to smooth image
qt	Threshold to accept strong edge candidate
excl	Number of pixels to exclude around edge of frame as candidates
rmin	Minimum circle radius
rmax	Maximum circle radius
rstep	step size in constructing lookup table
dtheta_max	maximum assumed error in gradient direction
dtheta_step	increment for dtheta
plots	plot?
details	Return extra details?
number	of nearest neighbors for alternate calculation

### Details

The Hough transform section first creates a lookup table of candidate radii and center points, then for each candidate edge point calculates potential centers along a fan of rays near the gradient direction. An inner join then finds matches in the lookup table and increments an accumulator vector. Highest vote at the end wins.

### Value

If details is FALSE a named list with the circle parameters

### Note

This is experimental and can be very slow. A good guess for the radius is very helpful. Experimental feature: find the nn nearest neighbors of the selected trio of parameters and calculate a vote weighted mean. This is returned as rxy\_alt if details is TRUE.

### See Also

[circle.pars\(\)](#), [pupil.pars\(\)](#)

**Examples**

```
example("psifit", package="zernike", ask=FALSE)
X11()
cp2 <- circle.hough(tfit$mod, rmin=round(tfit$cp$rx)-10, rmax=round(tfit$cp$rx)+10)
```

---

circle.pars	<i>Pupil parameters</i>
-------------	-------------------------

---

**Description**

Automatically determine the center and radius of a circular interferogram image.

**Usage**

```
circle.pars(im, fw=2, qt=0.995, excl=5,
  plots=TRUE, details=FALSE)
```

**Arguments**

im	A matrix containing an image of a circular disk
fw	Amount to smooth image
qt	Threshold to accept an edge point, expressed as a quantile
excl	number of pixels around border of frame to exclude
plots	Plot edge candidates and fit?
obstructed	Logical: is there a central obstruction?

**Details**

This routine partially implements the Canny algorithm for edge detection. After optionally smoothing the input image the gradient is calculated using a Sobel filter, and edge pixels are identified by locating local maxima in the magnitude of the gradient.

The edge pixels with qt percentile largest gradients are passed to `nlsrob` in package `robustbase` or `lqs` in package `MASS` to determine robustly the best fit circle.

**Value**

A list with the following components:

xc	X coordinate of the center of the pupil
yc	Y coordinate of the center of the pupil
rx	Horizontal radius of the pupil
ry	Vertical radius of the pupil = rx
obstruct	Obstruction fraction (always = 0)

**Note**

This routine is only effective on modulation estimates, and will almost certainly fail on interferogram images. Since data quality varies widely considerable experimentation may be needed on any given image. Increasing the smoothing parameter `fw` helps to suppress artifacts. Depending on how strong the actual edge is compared to artifacts `qt` may need to be either increased or decreased from the default value.

if `details==TRUE` several more pieces of data are returned. This is mostly for debugging purposes and may be eliminated in the future.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

Many routines require the pupil parameters in the form returned by `circle.pars`. For example [psifit](#), [fftfit](#), [pupil](#), etc.

---

col3d

*OpenGL plot*

---

**Description**

Returns a vector of colors similar to `image()` display.

**Usage**

```
col3d(surf, surf.col=topo.colors(256), zlim = NULL, eqa=FALSE)
```

**Arguments**

<code>surf</code>	A matrix of surface values
<code>surf.col</code>	Color palette for surface
<code>zlim</code>	Range of values to display
<code>eqa</code>	Equal area per color?

**Value**

A vector of color values the same length as `surf`.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**References**

The **rgl** package is described at <http://rgl.neoscientists.org/about.shtml>, and available from CRAN.

---

crop	<i>Crop an array</i>
------	----------------------

---

### Description

Crop a matrix or 3D array. Main application is to trim excess pixels from an image array, wavefront, etc.

### Usage

```
crop(img, cp, npad = 20, nxy=NULL)
```

### Arguments

img	Array to be cropped.
cp	A list describing the pupil boundary.
npad	Amount of padding to leave around the edge.
nxy	Number pixels per side in cropped array.

### Details

cp is the list provided by [circle.pars](#).

### Value

im	The cropped array
cp	Revised value of cp

### Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

---

fftfit	<i>Fourier transform interferogram analysis</i>
--------	---

---

### Description

High level routines for FFT analysis of interferograms.

### Usage

```
fftfit(imagedata, cp = NULL,
      sl = c(1, 1), filter = NULL, taper = 2,
      options = psfit_options())
```

**Arguments**

imagedata	A matrix containing the interferogram
cp	A list describing the pupil boundary, as returned by <a href="#">pupil.pars</a>
sl	Position of sidelobe in the form c(x,y)
filter	Size of background filter around DC
taper	Size of taper applied to edge of half plane cut
options	a list of parameters passed to other functions. See <a href="#">psfit_options</a> .

**Details**

If `is.null(filter)` (the default), [pick.sidelobe](#) will be called to select a Fourier domain sidelobe and background filter size.

If `is.null(cp)` [circle.pars](#) is applied to the modulation to estimate the pupil parameters.

See [wf\\_net](#) for details of the process of creating net and smoothed wavefronts from raw unwrapped wavefront maps.

**Value**

A list with the following components:

phase	Wrapped phase map
mod	The estimated modulation
cp	A list describing the pupil boundary
cp.orig	The precropped value of cp
wf.net	Net unsmoothed wavefront; a matrix of class " <a href="#">pupil</a> "
wf.smooth	Net smoothed wavefront
wf.residual	Difference between net wavefront and polynomial fit
fit	Return value from <a href="#">fitzernikes</a>
zcoef.net	Net Zernike coefficients from fit

**Note**

These functions are based largely on the work of Roddier and Roddier (1987).

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**References**

Roddier, C. and Roddier, F. 1987, **Interferogram analysis using Fourier transform techniques**, *Applied Optics*, vol. 26, pp. 1668-1673.

**See Also**

[wf\\_net](#), [pupil.pars](#), [pick.sidelobe](#).

**Description**

Miscellaneous utilities for working with 2D images in the Fourier domain.

**Usage**

```
wftophase(X, lambda=1)
padmatrix(X, npad, fill = mean(X, na.rm=TRUE))
submatrix(X, size = 255)
fftshift(X)
.up2(nr, nc=nr)
```

**Arguments**

<code>X</code>	A matrix
<code>lambda</code>	Value of the wavelength, in the same units as <code>X</code>
<code>npad</code>	Size of padded matrix
<code>fill</code>	Values to be assigned to padded matrix elements
<code>size</code>	Size of returned matrix
<code>nr</code>	A number
<code>nc</code>	A number

**Details**

`wftophase` computes the complex phase from wavefront values.

`padmatrix` pads a matrix to size `npad` x `npad`, placing the original matrix in the lower left hand corner of the padded matrix.

`submatrix` extracts a `size` x `size` matrix from the center of a larger matrix.

`fftshift` shuffles the quadrants of a matrix around to put the DC element (1,1) in the center of the transformed matrix, with spatial frequencies increasing to the right and up.

**Value**

A matrix transformation of the input matrix `X`.

`.up2` returns the next higher power of 2 than `max(nr, nc)`.

**Note**

These low level routines are used by several higher level functions that operate in the Fourier domain.

[startest](#), [fftfit](#).

---

fitzernikes

*Least Squares fit to Zernike polynomials*

---

**Description**

Performs a least squares fit of a specified set of Zernike polynomials to a vector of wavefront measurements.

**Usage**

```
fitzernikes(wf, rho, theta, eps=0, phi = 0, maxorder = 14, uselm = FALSE, isoseq = FALSE)
```

**Arguments**

wf	A vector of wavefront values
rho	A vector of radial coordinates.
theta	A vector of angular coordinates, in radians.
eps	Obstruction fraction of annular aperture.
phi	Orientation of the image, in degrees
maxorder	Maximum Zernike polynomial order
uselm	Boolean: use <code>lm()</code> for least squares fit
isoseq	Boolean: use ISO/ANSI sequencing

**Details**

wf, rho, and theta must be the same length.

As of version 3.7.0 Zernike polynomials in ISO/ANSI sequence can be used through a call to [zpm\\_cart](#).

**Value**

The model fit as returned by [lm](#), or the coefficients of the least squares fit using `qr.solve` if `uselm` is FALSE.

**Note**

The model fit is of the form  $wf \sim Z_0 + Z_1 + Z_2 + \dots$ . With the standard ordering of Zernikes  $Z_0$  is the piston term,  $Z_1$  and  $Z_2$  are x and y tilts,  $Z_3$  is defocus, etc.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

[zpm](#), [zpm\\_cart](#), [psifit](#), [fftfit](#), [vortexfit](#), [wf\\_net](#).

---

foucogram

---

*Simulate a Foucaultgram*

---

**Description**

Simulates the appearance of a wavefront under the Foucault test.

**Usage**

```
foucogram(wf, edgex = 0, phradius = 0, slit = FALSE,
          pad = 4, gamma = 1, map = FALSE, lev = 0.5)
```

**Arguments**

wf	An object of class <a href="#">pupil</a> containing wavefront values
edgex	lateral position of knife edge
phradius	radius of light source
slit	Logical: Is source a slit or pinhole?
pad	pad factor for FFT
gamma	Gamma value for graphics display
map	Logical: Overlay contours from wavefront map?
lev	Increment for contour levels, if used

**Details**

The default value of 0 for phradius simulates a monochromatic point source. Try values in the range 10-30 to suppress diffraction effects.

**Value**

A matrix of intensity levels in the simulated image.

**Note**

The key approximations here are treating the light source as monochromatic and spatially coherent, which is usually not the case for an extended source. Also, Fraunhofer diffraction theory is used.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**References**

See [http://home.netcom.com/~mpeck1/astro/foucault/ext\\_foucault.pdf](http://home.netcom.com/~mpeck1/astro/foucault/ext_foucault.pdf) for an outline of the mathematical treatment of an extended source.

gblur

*Gaussian blur*

---

**Description**

Blur an image by fw pixels

**Usage**

```
gblur(X, fw=0, details=FALSE)
```

**Arguments**

X	A matrix representing an image
fw	Width of the Gaussian convolution kernel, in pixels
details	Return convolution kernel?

**Details**

fw is the standard deviation of the Gaussian.

**Value**

The filtered matrix X.

**Note**

the details option is mostly for debugging purposes and may go away.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

[convolve2d](#)

---

gol_welsch	<i>Golub-Welsch method to find quadrature points and weights for Gauss-Legendre quadrature</i>
------------	--

---

**Description**

Calculates the nodes and weights for Legendre polynomials shifted to the interval  $(\text{eps}^2, 1)$ .

**Usage**

```
gol_welsch(eps, qwts)
```

**Arguments**

eps	obstruction fraction $0 \leq \text{eps} < 1$
qwts	an input R vector with length equal to the number of quadrature points.

**Details**

If  $N$  is the maximum polynomial order to be evaluated  $\text{qwts}$  should be at least of length  $N/2 + 1$ . Quadratures will then be nominally exact.

**Value**

a vector of quadrature nodes the same length as  $\text{qwts}$  in the open interval  $(\text{eps}^2, 1)$ .  $\text{qwts}$  will be overwritten with the quadrature weights.

**See Also**

Called by [zapm\(\)](#) and [zapm\\_iso\(\)](#).

---

gpcapsi	<i>Generalized Principal components algorithm for phase shifting interferometry</i>
---------	---

---

**Description**

A generalized principal components algorithm for phase shifting interferometry developed by the author. This is the “low level” implementation.

**Usage**

```
gpcapsi(im.mat, ptol = 0.001, maxiter = 20, trace = 1)
gpcapsiC(im.mat, ptol, maxiter, trace)
```

**Arguments**

im.mat	Matrix containing the unmasked pixels from a set of interferograms.
ptol	Convergence tolerance for phase shifts
maxiter	Maximum number of iterations
trace	Print progress of nonlinear solver every trace iterations. Use trace=0 for silent operation.

**Details**

gpcapsi is a wrapper to the C++ call in gpcapsiC.

**Value**

A list with the following items:

phi	Estimated wrapped phase.
mod	Estimated modulation.
phases	Estimated phase shifts.
snr	An estimate of the S/N of the interferograms.
eigen	Eigenvalues of the crossproduct matrix

**Note**

This is the low level interface to the algorithm. The matrix im.mat should contain the unmasked pixel values from the input interferogram array. No checks are made for valid data. This should normally be called through the high level function [psifit](#).

**Author(s)**

M. L. Peck

**See Also**

[pcapsi](#) [psifit](#)

---

gradzpm\_cart

*Zernike polynomials and cartesian gradients*

---

**Description**

Calculate Zernike polynomial values and Cartesian gradients in ISO/ANSI sequence for a set of Cartesian coordinates.

**Usage**

```
gradzpm_cart(x, y, maxorder = 12L, unit_variance = FALSE, return_zpm = TRUE)
```

## Arguments

<code>x</code>	a vector of x coordinates for points on a unit disk.
<code>y</code>	a vector of y coordinates.
<code>maxorder</code>	the maximum radial polynomial order (defaults to 12).
<code>unit_variance</code>	logical: return with orthonormal scaling? (default false)
<code>return_zpm</code>	logical: return Zernike polynomial matrix? (default true)

## Details

Uses the recurrence relations in the above publication to calculate Zernike polynomial values and their directional derivatives in Cartesian coordinates. These are known to be both efficient and numerically stable.

Columns are in ISO/ANSI sequence: for each radial order  $n \geq 0$  the azimuthal orders  $m$  are sequenced  $m = -n, -(n-2), \dots, (n-2), n$ , with sine components for negative  $m$  and cosine for positive  $m$ . Note this is the opposite ordering from the extended Fringe set and the ordering of aberrations is quite different. For example the two components of trefoil are in the 7th and 10th column while coma is in columns 8 and 9 (or 7 and 8 with 0-indexing). Note also that except for tilt and coma-like aberrations ( $m=1$ ) non-axisymmetric aberrations will be separated.

All three matrices will have the same dimensions on return. Columns 0 and 1 of `dzdx` will be all 0, while columns 0 and 2 of `dzdy` are 0.

## Value

a named list with the matrices `zm` (optional but returned by default), `dzdx`, `dzdy`.

## References

Anderson, T.B. (2018) Optics Express 26, #5, 18878 <https://doi.org/10.1364/OE.26.018878> (open access)

## See Also

`zpm()` uses the same recurrence relations for polar coordinates and extended Fringe set ordering, which is the more common indexing scheme for optical design/testing software.

`zpm_cart()` calculates and returns the Zernike polynomial values only.

## Examples

```
rho <- seq(0.2, 1., length=5)
theta <- seq(0, 1.6*pi, length=5)
rt <- expand.grid(theta, rho)
x <- c(0, rt[,2]*cos(rt[,1]))
y <- c(0, rt[,2]*sin(rt[,1]))
gzpm <- gradzpm_cart(x, y)
```

---

gray256	<i>8 bit Grayscale</i>
---------	------------------------

---

**Description**

A vector of gray scale levels

**Usage**

```
gray256  
grey256
```

**Value**

Defined as `gray256 <- grey(seq(0,1,length=256))`

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>.

---

hypot	<i>Hypotenuse</i>
-------	-------------------

---

**Description**

The Euclidean length of a vector

**Usage**

```
hypot(x)
```

**Arguments**

x	a vector
---	----------

**Value**

the length of the vector

**Author(s)**

M.L. Peck

**Examples**

```
hypot(c(1,2))
```

idiffpuw

*Phase unwrapping by Integrating DIFFerences***Description**

Simple path following algorithm for two dimensional phase unwrapping.

**Usage**

```
idiffpuw(phase, mask = phase, ucall = TRUE, dx = NULL, dy = NULL)
```

**Arguments**

phase	A matrix of wrapped phase values
mask	Matrix the same size as phase indicating masked pixels
ucall	Boolean: User call?
dx	Matrix of x differences
dy	Matrix of y differences

**Details**

mask indicates pixels that shouldn't be unwrapped. In the simplest (default) case these are just pixels where phase is undefined.

**Value**

if(ucall), a matrix of class "[pupil](#)" with unwrapped wavefront values, otherwise a list with items:

puw	Unwrapped phase
uw	Matrix indicating pixels that have been unwrapped.

**Note**

[brcutpuw](#) calls [rmap](#) first to check for the presence of residues. If there are none idiffpuw is guaranteed to work and is called to do the phase unwrapping.

If there *are* residues brcutpuw creates a mask then calls idiffpuw to unwrap unmasked portions of the phase map.

This function is user callable as well; use a call of the form idiffpuw(phase).

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>. Thanks to Steve Koehler for programming ideas to considerably speed up the algorithm.

**References**

---

id\_dxy\_uw

---

*Compiled code via Rcpp for Itoh's method of phase unwrapping*

---

**Description**

Called by [brcutpuw\(\)](#) for fast phase unwrapping

**Usage**

```
id_dxy_uw(nr, nc, phase, mask, dx, dy, uw)
```

**Arguments**

nr	number of rows in phase matrix
nc	number of columns in phase matrix
phase	phase matrix converted to vector
mask	matrix of mask values converted to vector
dx	wrapped phase differences in x direction
dy	wrapped phase differences in y direction

**Details**

This is called by [brcutpuw\(\)](#) through [idiffpuw\(\)](#) but is also user callable. Wrapped phase values and differences are divided by  $2\pi$  before input making the input values in the range  $[-1/2, 1/2)$ . In [brcutpuw\(\)](#) the mask indicates areas outside the interferogram area and lines of branch cuts

**Value**

a vector with the unwrapped phase

**Author(s)**

M.L. Peck (mlpeck54 -at- gmail.com)

**See Also**

[brcutpuw\(\)](#), [idiffpuw\(\)](#)

---

`id_uw`*Compiled code via Rcpp for Itoh's method of phase unwrapping*

---

## Description

Called by `idiffpuw()` for fast phase unwrapping

## Usage

```
id_uw(nr, nc, phase)
```

## Arguments

<code>nr</code>	number of rows in phase matrix
<code>nc</code>	number of columns in phase matrix
<code>phase</code>	phase matrix converted to vector

## Details

This is called by `idiffpuw()` but is also user callable. Wrapped phase values are divided by  $2\pi$  before input making the input values in the range  $[-1/2, 1/2]$ . In `brcutpuw()` the mask indicates areas outside the interferogram area and lines of branch cuts

## Value

a vector with the unwrapped phase

## Author(s)

M.L. Peck (mlpeck54 -at- gmail.com)

`brcutpuw()`, `idiffpuw()`

---

load.images	<i>Read images</i>
-------------	--------------------

---

**Description**

Loads image files in jpeg, tiff or raw format. load.pgm provides legacy support for reading files in pgm format.

**Usage**

```
load.images(files, channels=c(1,0,0), scale=1, FLIP=FALSE)
load.pgm(files, imdiff=NULL)
```

**Arguments**

files	A vector of character strings with file names
channels	channel weights
scale	scale factor for image resize
FLIP	flip image left for right?

**Details**

set FLIP=TRUE to reverse mirror imaged interferograms.

Any file extension other than jpg, jpeg, tif, tiff is assumed to be in RAW format. Supported raw formats are determined by libraw and may not be up to date

**Value**

An array containing the contents of the image files.

**Note**

load.pgm is the original load.images included for legacy support of greyscale portable anymap files.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

---

`lspsi`*Phase Shifting Interferometry*

---

**Description**

Least squares fitting of phase shifted interferograms.

**Usage**

```
lspsi(images, phases, wt = rep(1, length(phases)))  
lspsiC(images, phases, wt)
```

**Arguments**

<code>images</code>	An array containing the interferogram images
<code>phases</code>	A vector of phase shifts
<code>wt</code>	A vector of weights

**Details**

`images` is a 3 dimensional array with dimensions `nrow` x `ncol` x `length(phases)`, where `nrow` and `ncol` are the number of rows and columns in the individual interferogram images.

`lspsi` reshapes the image array into a matrix and calls `lspsiC` which in turn calls the compiled C++ routine.

**Value**

A list containing the following components:

<code>phi</code>	Estimated wrapped wavefront phase.
<code>mod</code>	Estimated modulation

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

[psifit](#)

---

makezlist.iso	<i>Construct list of ZP indexes in ISO/ANSI sequence with sine terms first</i>
---------------	--

---

**Description**

Construct list of ZP indexes in ISO/ANSI sequence with sine terms first

**Usage**

```
makezlist.iso(maxorder = 12)
```

**Arguments**

maxorder	maximum radial and azimuthal order
----------	------------------------------------

**Value**

a named list with n=radial indexes, m=azimuthal, and t indicating trig function to apply

**Examples**

```
zlist.iso <- makezlist.iso(maxorder=6)
zlist <- makezlist(0, 6)
```

---

mpinv	<i>Moore-Penrose generalized inverse</i>
-------	--

---

**Description**

Computes the Moore-Penrose generalized inverse of a matrix using singular value decomposition.

**Usage**

```
mpinv(X)
```

**Arguments**

X	A matrix
---	----------

**Value**

Matrix containing the generalized inverse. If X is an n x m matrix the return will have dimension m x n.

**Note**

The threshold for determining if a matrix is rank deficient is `eps <- .Machine$double.eps * max(dim(X)) * S$d[1]`

**Author(s)**

M. L. Peck

**Examples**

```
X <- matrix(rnorm(18), 6, 3) ## this should be full rank almost always
mpinv(X) %*% X

X <- matrix(1:18, 6, 3) ## this is not
mpinv(X) %*% X
```

---

norm\_zpm

*Normalize matrix of Zernike polynomial values.*

---

**Description**

Convert a matrix of Zernike polynomial values from unit scaled to unit variance aka orthonormal form.

**Usage**

```
norm_zpm(uzpm, maxorder = 12L)
```

**Arguments**

uzpm	matrix of Zernike polynomial values
maxorder	the maximum radial order.

**Details**

This is intended only for ISO/ANSI ordered matrices. The only check performed is that the number of columns in the matrix matches the expected number given by the argument `maxorder`. This is called by [gradzpm\\_cart\(\)](#) and [zpm\\_cart\(\)](#) if `unit_variance` is set to `true` in the respective function calls.

**Value**

matrix in orthonormal form.

---

pcapsi*Vargas et al.'s Principal Components method for PSI*

---

**Description**

Compute the phase using the Principal components algorithm.

**Usage**

```
pcapsi(im.mat, bgsub = TRUE, group_diag = "v")
```

**Arguments**

im.mat	A <i>matrix</i> of interferogram values
bgsub	Boolean - subtract the pixelwise mean as background estimate?
group_diag	controls treatment of singular values of the data matrix

**Details**

Images are input into an array by [load.images](#). This must be reshaped into a matrix for this function. Also, a mask should be applied if available prior to the call.

**Value**

A list containing the following elements:

phi	The wrapped phase estimate. This is a vector as long as the number of rows in im.mat.
mod	Modulation estimate.
phases	Phase shift estimates.
snr	An estimate of the signal to noise ratio in the input data.
eigen	Singular values of the crossproduct matrix.

**Author(s)**

<code>pick.sidelobe</code>	<i>Select an interferogram sidelobe in the Fourier domain</i>
----------------------------	---

---

**Description**

Interactively locate the center of a first order sidelobe in the FFT of an interferogram, and mark the width of the background filter.

**Usage**

```
pick.sidelobe(imagedata, logm=FALSE, gamma=3)
```

**Arguments**

<code>imagedata</code>	A matrix containing an interferogram image
<code>logm</code>	Logical: pass <code>fn="logMod"</code> to <a href="#">plot.cmat</a> ?
<code>gamma</code>	gamma value for display

**Details**

Uses the basic graphics utility [locator](#).

**Value**

A list with the following components:

<code>sl</code>	The coordinates $c(x, y)$ of the selected sidelobe
<code>filter</code>	Estimated size of background filter

**Note**

The high level FFT interferogram analysis routine [fftfit](#) requires the approximate location of the intended first order interferogram sidelobe to be specified.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**[fftfit](#),

---

plot.cmat	<i>Plot a complex matrix</i>
-----------	------------------------------

---

### Description

Plot a real valued function of a complex matrix

### Usage

```
plot.cmat(X, fn = "Mod", col = grey256,  
cp=NULL, zoom=1, gamma=1, ...)
```

### Arguments

X	A complex valued matrix
fn	A function returning a real value
col	Color palette for graph
cp	pupil parameters as returned by <a href="#">pupil.pars</a>
zoom	zoom factor for display
gamma	gamma value for display
...	Other parameters to pass to <a href="#">image.default</a>

### Details

In addition to the functions described in [complex](#) fn can be assigned the values "logMod", which will call an internally defined function returning the value  $\log(1+\text{Mod}(X))$ , "Mod2" to plot the power spectrum, and "logMod2" to plot the logarithm of the power spectrum.

If the parameter cp is passed axes will display spatial frequencies in cycles per pupil radius.

### Value

none

### Note

This is used primarily for displaying FFT's of interferograms. In the case of an interferogram in which the background has not been removed use fn="logMod" to make the first order sidelobes visible.

### Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

plot.pupil

*Pupils and wavefronts*

---

## Description

Plot and summary methods for objects of class "pupil".

## Usage

```
plot.pupil(wf, cp=NULL, col = topo.colors(256), addContours = TRUE, cscale = FALSE,
           eqa=FALSE, zlim=NULL, ...)
summary.pupil(wf)
```

## Arguments

wf	An object of class "pupil"
cp	Pupil parameters; a list as returned by <a href="#">pupil.pars</a>
col	Color palette for plot
addContours	Logical: add contour lines?
cscale	Add a color scale legend?
eqa	Perform an "equal area" plot?
zlim	z limits to pass to image
...	Additional parameters to pass to <a href="#">image.default</a>

## Details

These give simple plot and summary methods for objects of class [pupil](#).

If eqa is TRUE, each color in the palette will be used for an equal number of pixels (as opposed to representing an equal interval). Note: the color scale (when cscale == TRUE) may be inaccurate if a very small number of colors are used.

## Value

none

---

`plotn`*Wavefront comparison plots*

---

**Description**

Plot an arbitrary number of wavefronts and all differences.

**Usage**

```
plotn(..., labels = NULL, addContours=FALSE, wftype = "net",  
col = rygcb(400), qt = c(0.01, 0.99))
```

**Arguments**

<code>...</code>	List of wavefront estimates as returned by <a href="#">wf_net</a> .
<code>labels</code>	Labels to identify the wavefronts.
<code>addContours</code>	Boolean to add contours to top row plots
<code>wftype</code>	If the inputs are from <code>wf_net</code> , one of "net", "smooth", "residual".
<code>col</code>	Color palette for top row of plot
<code>qt</code>	Quantiles of differences to plot in comparisons.

**Details**

`...` can be any number of objects containing wavefront estimates as returned for example by [wf\\_net](#).

Wavefronts are displayed on the top row, and differences of all pairs on subsequent rows. Grayscale is used to render the difference plots, and the color palette given in `col` is used for the wavefronts.

**Value**

none

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

[plot.pupil wf\\_net](#)

---

plotxs

---

*Plot cross-sections (profiles) through a wavefront map.*

---

### Description

Plots an arbitrary number of cross-sections through a wavefront map, with one highlighted.

### Usage

```
plotxs(wf, cp, theta0 = 0, ylim = NULL, N = 4, n = 101,
col0 = "black", col = "gray", lty = 2)
```

### Arguments

wf	A matrix of wavefront values.
cp	List of pupil parameters as returned by <a href="#">pupil.pars</a> .
theta0	Angle of highlighted profile, in degrees.
ylim	range of heights to plot.
N	Number of cross sections.
n	Number of points for each cross section.
col0	Highlight color.
col	Cross section color.
lty	Line type for plots.

### Details

The cross sections are equally spaced in angle from 0 to  $\pi \cdot (N-1)/N$ . Any angle can be specified for the highlighted profile at theta0.

### Value

none

### Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

### See Also

[plot.pupil](#) is the main wavefront plotting routine.

---

psfit\_options

Options for PSI and FFT based fitting routines

---

### Description

Get and optionally set parameters controlling various aspects of PSI algorithms, Zernike polynomial fitting, and data display

### Usage

```
psfit_options(...)
```

### Arguments

colors	topo.colors(256)
refine	TRUE
puw_alg	"qual"
fringescale	1
wt	NULL
bgsub	TRUE
maxiter	20
ptol	1e-04
trace	1
nzcs	2
zc0	6:7
satarget	c(0, 0)
astig.bath	c(0, 0)
maxorder	14
uselm	FALSE
isoseq	FALSE
usecirc	FALSE
sgs	1
nthreads	parallel::detectCores()/2
plots	TRUE
crop	FALSE

## Details

Calling `psfit_options` with an empty argument list returns the default values of the options used in `psifit` and `wf_net` as itemized above. The list can be modified directly or by passing argument value pairs to the function call.

Parameters you might want to change include:

`satarget` sets the target SA for “numerical nulling.” This is a vector of length 2 setting the target values of primary and 5th order SA.

`ptol` sets convergence tolerances for iterative PSI algorithms. These have different definitions and different values may be suitable for different algorithms. A value around 0.01 is appropriate for `tiltpsi`.

The number of variable Zernike terms in the algorithm `tiltpsi` is controlled by `nzcs`. Set it to 3 to include defocus, 5 to include primary astigmatism, 7 to include coma.

`maxorder` sets the maximum Zernike polynomial order for wavefront fitting. It must be even and at least 6. The default generally produces a good wavefront representation but you may want to experiment with higher order fits.

Parameters `isoseq` and `usecirc` control which sets of Zernike (annular) polynomials are called for wavefront fitting. If Zernikes in ANSI/ISO sequence are desired set `isoseq` = TRUE. The default FALSE uses extended Fringe ordering. Set `usecirc` = TRUE if you want to use Zernike circle polynomials even for obstructed wavefronts.

`puw_alg` specifies the phase unwrapping algorithm. Current options are "qual", "brcut", "lpbrcut", and "lp".

A new and somewhat experimental feature from version 3.6.0 of the package is threaded computation of Zernike polynomial matrices. The number of threads used is set with the option `nthreads`. The default is to use half the number of cores detected because on CPUs that support multi- or hyperthreading the number of cores reported by `detectCores()` is double the number of physical cores. Setting `nthreads` = 1 will turn off threading. Different C++ routines are used for the matrix fill in the unthreaded (`zpmC`) and threaded (`zpmCP`) cases. Speed improvements, if any, may vary.

If you don't like the default color palette there are many other choices. If you like rainbows `rygcb` defined in this package produces a relatively perceptually uniform version that's well suited for display on an RGB monitor.

## Value

A named list with the current values of the arguments.

## Author(s)

M.L. Peck <mlpeck54@gmail.com>

---

psifit                      *Phase Shifting Interferometry*

---

**Description**

High level function for Least squares analysis of phase shifted interferograms.

**Usage**

```
psifit(images, phases, cp = NULL, satarget = NULL, psialg = "ls", options = psifit_options())
```

**Arguments**

images	An array containing the interferogram images
phases	A vector of phase shifts
cp	A list describing the pupil boundary, as returned by <a href="#">pupil.pars</a>
satarget	Target 4th and 6th order SA coefficients in non-null tests of aspheres
psialg	String identifying the PSI algorithm to use
options	a list of options

**Details**

images is a 3 dimensional array with dimensions nrow x ncol x length(phases), where nrow and ncol are the number of rows and columns in the individual interferogram images.

The current values recognized for psialg are

**ls** least squares with known phase shifts

**aia** the “advanced iterative algorithm“ [aiapsi](#)

**pc1** pca with group\_diag = "v"

**pc2** pca with group\_diag = "u"

**gpc** my generalized PC algorithm in [gpcapsi](#)

```

pupil

*Pupils and wavefronts***Description**

Create a pupil object and optionally fill it with a wavefront. For our purposes a “pupil” is defined to be a matrix representation of a circular or annular aperture. Simple plot and summary methods are also provided.

**Usage**

```
nrow.default <- 640
ncol.default <- nrow.default
cp.default <- list(xc=320.5, yc=320.5, rx=319.5, ry=319.5, obstruct=0)

pupil(zcoef=NULL, maxorder=14L, isoseq=FALSE,
      phi=0, piston=NULL,
      nrow=nrow.default, ncol=ncol.default,
      cp=cp.default)
pupil.arb(zcoef=NULL, zlist=makezlist(),
          phi=0, piston=0,
          nrow=nrow.default, ncol=ncol.default,
          cp=cp.default)
```

**Arguments**

<code>zcoef</code>	A vector of Zernike coefficients
<code>maxorder</code>	Maximum Zernike polynomial order
<code>zlist</code>	List of indexes the same length as <code>zcoef</code>
<code>isoseq</code>	ZPs in ISO/ANSI sequence
<code>phi</code>	Amount to rotate image, in degrees
<code>piston</code>	Constant to add to wavefront values
<code>nrow</code>	Number of rows in output matrix
<code>ncol</code>	Number of columns in output matrix
<code>cp</code>	A list with items <code>xc</code> - x coordinate of central pixel, <code>yc</code> - y coordinate of central pixel, <code>rx</code> - x radius in pixels, <code>ry</code> - y radius in pixels, <code>obstruct</code> - central obstruction fraction.

**Details**

[plot.pupil](#) and [summary.pupil](#) provide simple plot and summary methods for objects of class “pupil”.

`pupil.arb` will accept an arbitrary list of Zernike indexes.

`pupil` requires a complete set of Zernikes as returned by [zpm](#) or [zpm\\_cart](#).

Default values `nrow.default`, `ncol.default` and `cp.default` are now (as of version 3.7.0) stored in the package environment. These can be used or overridden by setting values in the user's global environment.

Version 3.7.0 of this package makes some fairly significant changes in `pupil` from previous releases. First, `zlist` is no longer used to indicate the set of Zernikes used. Instead the maximum radial order is passed as `maxorder`, defaulting to 14. The complete set of Zernike polynomial values including piston is calculated with either `zpm` or `zpm_cart` if `isoseq` is `TRUE`. The vector `zcoef`, if non-null, must be either the same length as the number of columns in the zernike matrix with a null value for piston, or one shorter with a non-null value for piston. The vector `zcoef.net` returned by `wf_net` has the first, piston, element removed so a non-null piston value must be passed as an argument.

### Value

A matrix of size `nrow` x `ncol`. The matrix is assigned to the class "pupil". NAs are used to fill the matrix outside the defined area of the pupil.

### Note

The parameter `cp` is used to define the dimensions of the pupil. See [pupil.pars](#) for details.

### Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

### See Also

[zpm](#), [zpm\\_cart](#), [wf\\_net](#), [pupilrms](#), [pupilpv](#), [strehlratio](#), [pupil.pars](#), [circle.pars](#).

### Examples

```
wf <- pupil(zcoef=rnorm(length(makezlist(0, 14)$n), 0, 0.01))
plot(wf, addContours=FALSE)
summary(wf)
```

---

pupil.pars

*Pupil parameters*

---

### Description

Interactively determine the center, radius, and obstruction fraction of a circular or annular interferogram image.

### Usage

```
pupil.pars(im = NULL, obstructed = FALSE)
```

**Arguments**

im	A matrix containing an interferogram image
obstructed	Logical: is there a central obstruction?

**Details**

In `pupil.pars`, if the image has already been plotted `im` can be `NULL`, which is the default.

**Value**

A list with the following components:

xc	X coordinate of the center of the pupil
yc	Y coordinate of the center of the pupil
rx	Horizontal radius of the pupil
ry	Vertical radius of the pupil
obstruct	Obstruction fraction

**Note**

`pupil.pars` uses the basic graphics library routine [locator](#) to interactively mark the edge of the pupil, and optionally the edge of the obstruction. After right clicking to terminate `locator()` a least squares fit is performed to the marked points to determine the center and radius of the pupil.

Note that all routines that make use of Zernikes implicitly assume a circular pupil, or an annular one with small obstruction. We allow  $rx \neq ry$  for imaging sensors with non-square aspect ratios.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

Many routines require the pupil parameters in the form returned by `pupil.pars`. For example [psifit](#), [fftfit](#), [pupil](#), etc.

---

pupil.rhotheta	<i>Polar coordinates</i>
----------------	--------------------------

---

**Description**

Calculate matrixes of polar coordinates for [pupil](#)'s.

**Usage**

```
pupil.rhotheta(nrow, ncol, cp)
```

**Arguments**

nrow	Number of rows in interferogram images
ncol	Number of columns in interferogram images
cp	A list describing the pupil boundary, as returned by <a href="#">pupil.pars</a>

**Value**

A list with the following components:

rho	A matrix of radial coordinates
theta	A matrix of angular coordinates

**Note**

My Zernike polynomial routines work in polar coordinates, which this function provides. Also, NA's are used to fill the matrix outside the pupil boundary, making the returned values convenient for selecting pixels inside interferograms.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

[Zernike](#), [pupil](#).

---

pupilrms

*Wavefront statistics*

---

**Description**

Compute basic statistics of wavefronts stored in "pupil" objects.

**Usage**

```
pupilrms(pupil)
pupilpv(pupil)
strehlratio(rms)
```

**Arguments**

pupil	A matrix of class "pupil"
rms	An rms wavefront error

**Value**

Estimates of the RMS and P-V wavefront errors. strehratio calculates Mahajan's approximation to the Strehl ratio.

**Note**

pupilrms simply calculates the standard deviation of finite values in the matrix pupil. This is a crude, but usually accurate enough estimate of the true RMS wavefront error.

[summary.pupil](#) calls these functions.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**Examples**

```
zcoef <- rnorm(length(makezlist())$n, 0, 0.01)
wf <- pupil(zcoef=zcoef)
plot(wf)
summary(wf)
sqrt(crossprod(zcoef)) # A more accurate estimate of RMS
```

---

PVr

Zygo's "robust" PV

---

**Description**

A peak to valley error estimate that reduces the effect of noise and artifacts

**Usage**

```
PVr(wf.zfit, wf.residual)
```

**Arguments**

wf.zfit	matrix containing the smoothed Zernike fit wavefront
wf.residual	matrix of the difference between the raw wavefront and the Zernike fit. These values are returned by <a href="#">wf_net()</a>

**Details**

no check is performed on the wavefronts, so it's the user's responsibility to make sure these come from the same source

**Value**

the estimated PVr

**References**

---

qpuw

*Quality guided algorithm for phase unwrapping*

---

**Description**

Quality guided algorithm for two dimensional phase unwrapping.

**Usage**

qpuw(phase, qual)

**Arguments**

phase	A matrix of wrapped phase values
qual	A matrix of quality values the same size as phase.

**Value**

puw                      A matrix of class "[pupil](#)" with the unwrapped wavefront.

**Note**

This is a straightforward implementation of the quality guided algorithm of G&P.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**References**

Ghiglia, D.C., and Pritt, M.D., 1998, **Two-Dimensional Phase Unwrapping**, New York: Wiley & Sons, Inc., ISBN 0-471-24935-1.

**See Also**

[idiffpuw](#), [brcutpuw](#)

---

q\_uw*Compiled code via Rcpp for quality guided phase unwrapping*

---

## Description

Called by `qpuw()` for fast quality guided phase unwrapping

## Usage

```
q_uw(nr, nc, phase, qual)
```

## Arguments

nr	number of rows in phase matrix
nc	number of columns in phase matrix
phase	phase matrix converted to vector
qual	quality matrix converted to vector

## Details

This is called by `qpuw()` but is also user callable. Wrapped phase values are divided by  $2\pi$  before input making the input values in the range  $[-1/2, 1/2)$ .

## Value

a vector with the unwrapped phase

## Author(s)

M.L. Peck (mlpeck54 -at- gmail.com) with valuable programming advice from Steve Koehler

## See Also

`qpuw()`, `idiffpuw()`

---

readjpeg	<i>Read a jpeg or tiff file</i>
----------	---------------------------------

---

**Description**

Reads a jpeg or tiff file and combines the channels to produce a monochrome image in a matrix.

**Usage**

```
readjpeg(filename, channels)
readtiff(filename, channels)
```

**Arguments**

filename	File name
channels	A vector of length 3 with the channel weights

**Details**

Values in channels should be non-negative, but need not add to one.

**Value**

A double precision matrix with the image data.

**Note**

The matrix must have rows reversed and transposed to display properly with `image()`.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

---

rescale	<i>Rescale an image.</i>
---------	--------------------------

---

**Description**

Rescale a matrix containing a bitmapped image using bilinear interpolation.

**Usage**

```
rescale(im, scale)
```

**Arguments**

im	A matrix with image data.
scale	Scale factor.

**Details**

A value <1 will shrink the image.

**Value**

A matrix containing the rescaled image data.

**Note**

NA's are OK.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

Called by [load.images](#) if necessary.

---

rmap

*Utilities for phase unwrapping*

---

**Description**

Utility functions for use in 2D phase unwrapping.

**Usage**

```
rmap(phase, dx = NULL, dy = NULL, plot = FALSE, ...)  
wrap(phase)
```

**Arguments**

phase	Matrix of wrapped phase values
dx	Matrix of x differences
dy	Matrix of y differences
plot	Boolean: plot residue positions?
...	additional arguments for image

**Details**

dx and dy must have the same dimension as phase.

**Value**

In rmap if plot == TRUE

nr                      the number of residues identified in the map

otherwise

phase                  wrapped phase returned by wrap

residues              Matrix the same size as phase with residues marked as + or - 1.

**Note**

These are primarily intended for internal use but can be used interactively. Calling rmap(phase, plot=TRUE) will plot the positions of residues and return nothing. If (plot==FALSE) in the call to rmap a matrix the same size as phase is returned with residues identified with values of +1 or -1.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>. Steve Koehler is responsible for the efficient implementation of the wrap function.

**References**

Ghiglia, D.C., and Pritt, M.D., 1998, **Two-Dimensional Phase Unwrapping**, New York: Wiley & Sons, Inc., ISBN 0-471-24935-1.

**See Also**

Called by [brcutpuw](#).

---

rygcb	<i>A better rainbow.</i>
-------	--------------------------

---

**Description**

Produces a rainbow color palette with colors ranging from "red" to "blue" or "magenta". Perceptual uniformity should be superior to R's rainbow.

**Usage**

```
rygcb(n)
rygcbm(n)
```

**Arguments**

n                      Number of color levels

**Details**

The palette is created using `colorRampPalette`.

**Value**

A vector of colors.

**Note**

The call to `colorRampPalette` sets `space="Lab"` and `interpolate="spline"` with the intent of creating a more perceptually uniform rainbow.

**Author(s)**

M.L. Peck

**See Also**

```
plotsp <- function(spectrum) {
  sl <- length(spectrum)
  rgbv <- col2rgb(spectrum)
  plot((0:(sl-1))+0.5, rgbv[1,], type="l", col="red", xlim=c(0,sl),ylim=c(0,300),xlab="Index",ylab="Channel value")
  points((0:(sl-1))+0.5, rgbv[2,], type="l", col="green")
  points((0:(sl-1))+0.5, rgbv[3,], type="l", col="blue")
  grid()
  rect(0:(sl-1), 260, 1:sl, 300, col=spectrum, density=NA)
}
plotsp(rygcb(400))
X11()
plotsp(rygcbm(500))
```

---

 rzernike\_ann

*Radial Zernike Annular polynomials*

---

**Description**

Create a matrix of Zernike Annular polynomial values in extended Fringe sequence for a set of polar coordinates.

**Usage**

```
rzernike_ann(rho, eps, n, m, xq, qwts)
```

**Arguments**

rho	a vector of radial coordinates.
eps	the obstruction fraction $0 \leq \text{eps} < 1$ .
n	the maximum radial order required
m	azimuthal order
xq	nodes for Gauss-Legendre quadrature
qwts	weights for Gauss-Legendre quadrature

**Details**

To the author’s knowledge no recurrence relations for radial Zernike annular polynomials have been published, even though several are well known for the closely related Zernike circle polynomials. However the  $m=0$  polynomials representing axially symmetric aberrations are just shifted Legendre polynomials with an easily derived recurrence relation. This routine makes use of that fact to generate recurrence relations for arbitrary polynomial indexes using chebyshev’s algorithm with modified moments. The modified moments are calculated using Gauss-Legendre quadrature. If enough quadrature nodes were chosen the quadrature is nominally exact, as are the resulting annular Zernike values.

**Value**

A  $\text{length}(\text{rho}) \times (n-m)/2+1$  column matrix of radial Zernike Annular polynomial values evaluated at the input radial coordinates. The radial indexes are in increasing order from  $m, m+2, \dots, n$ .

**See Also**

This function is called by [zapm\(\)](#) and [zapm\\_iso\(\)](#).

---

<code>rzernike_ann_direct</code>	<i>Radial Zernike annular polynomials from formulas</i>
----------------------------------	---

---

**Description**

The first 15 radial Zernike annular polynomials copied from Table 1 of Mahajan (1994)

**Usage**

```
rzernike_ann_direct(rho, eps, j)
```

**Arguments**

rho	a vector of radial coordinates.
eps	the obstruction fraction $0 \leq \text{eps} < 1$ .
j	index of the value to fetch

Details

This function is included for testing and reference only.

Value

A vector of radial Zernike annular polynomial values at the coordinates rho for index j

References

Mahajan, V. N. (1994). Zernike Annular Polynomials and Optical Aberrations of Systems with Annular Pupils. *Supplement to Applied Optics* **33**, 8125-8127.

See Also

This function is called by [zapm\\_direct\(\)](#) and [zapm\\_iso\\_direct\(\)](#). Complete sequences to arbitrary order can be calculated with [rzernike\\_ann\(\)](#) and [rzernike\\_ann\\_128\(\)](#).

---

sconic	<i>Sconic</i>
--------	---------------

---

Description

twice the radial height difference between a sphere and conic surface

Usage

```
sconic(D, rc, b = -1, eps = 0., lambda = 632.8, nmax = 6)
```

Arguments

D	Diameter (mm)
rc	Radius of curvature (mm)
b	conic constant (default -1)
eps	obstruction fraction (default 0)
lambda	source or test wavelength (nm)
nmax	maximum polynomial order

Details

For the typical use case D and rc should be in millimeters and lambda in nanometers.  
If eps > 0 Zernike annular coefficients will be computed and returned.

Value

Zernike polynomial coefficients. The default returns the 4th and 6th order coefficients in a length two vector.

**Note**

This estimates twice the radial distance between a sphere and conic surface with same paraxial radius of curvature, and returns Zernike coefficients of polynomial expansion. Intended for “numerical nulling” when testing an asphere at center of curvature, and should be more accurate than the vertical height difference calculated by [zconic](#) for that purpose.

**Author(s)**

M.L. Peck

**See Also**

[zconic](#)

**Examples**

```
2.*zconic(1000,5000)
sconic(1000,5000)
```

---

startest	<i>Star test simulator</i>
----------	----------------------------

---

**Description**

Simulates a star test.

**Usage**

```
startest(wf=NULL, zcoef=NULL, maxorder=14L, phi=0,
lambda = 1, defocus=5, cp=NULL,
obstruct=NULL, npad = 4,
gamma=2, psfmag=2, displaymtf=TRUE, displaywf=FALSE)
```

**Arguments**

wf	A matrix of class pupil containing wavefront values
zcoef	Vector of Zernike coefficients
maxorder	maximum Zernike polynomial order
phi	Angle to rotate wavefront
lambda	Wavelength, in same units as coefficients
defocus	Amount of defocus in waves
cp	pupil parameters
obstruct	Obstruction fraction
npad	Pad factor for FFT
gamma	Gamma value for graphics display

psfmag	Magnification factor for in focus PSF display
displaymtf	Logical: Display MTF?
displaywf	Logical: Display calculated wavefront?

### Details

If wf is NULL the wavefront is calculated from the the Zernike coefficients (which should be non-NULL).

### Value

A list with the following components:

psf	The in focus point spread function.
otf	The complex optical transfer function, a complex matrix of size pupilsize.
mtf	The modulation transfer function, a real matrix of size pupilsize.

### Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

### References

Born, M. and Wolf, E. 1999, *Principles of Optics, 7th Edition*, Cambridge University Press.

---

summary.wf_fitted	<i>Methods for class "wf_fitted"</i>
-------------------	--------------------------------------

---

### Description

Summary, print, and plot methods for the returned list of values from [psifit\(\)](#), [fftfit\(\)](#), or [vortexfit\(\)](#)

### Usage

```
## S3 method for class 'wf_fitted'
summary(wffit, digits = 3)
```

### Arguments

wffit	the return values from one of the fringe analysis routines
digits	number of digits to display in print and summary methods
...	values passed to <a href="#">plot.pupil()</a>

**Value**

print method returns data frame with Zernike coefficients

---

synth.interferogram	<i>Synthetic interferogram</i>
---------------------	--------------------------------

---

**Description**

Compute and display a synthetic interferogram.

**Usage**

```
synth.interferogram(wf = NULL, zcoef = NULL, maxorder = NULL,
                    nr = nrow(wf), nc = ncol(wf), cp = NULL,
                    phi = 0, addzc = rep(0, 4), fringescale = 1,
                    plots = TRUE)
```

**Arguments**

wf	A matrix of wavefront values
zcoef	A vector of Zernike coefficients
maxorder	Maximum Zernike polynomial order
nr	Number of rows in the output matrix
nc	Number of columns in the output matrix
cp	A list describing the pupil boundaries, as created by <a href="#">pupil.pars</a>
phi	Amount to rotate the wavefront, in degrees
addzc	A 4-vector with piston, tilt, and defocus terms to be added
fringescale	Fringe scale. Should be 1 for single pass, 0.5 for double, etc.
plots	Logical: Plot the interferogram?

**Details**

Either wf or zcoef must be non-null, but not both. If zcoef is specified maxorder must be as well. Additional piston, tilt, and defocus terms can be added to the calculated wavefront using addzc.

**Value**

A matrix of intensity levels in the calculated interferogram, assigned class "[pupil](#)".

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**[pupil.](#)**Examples**

```
# create a list of zernikes
zcoef <- rnorm(length(zlist.fr$n), mean=0, sd=0.01)

iwf <- synth.interferogram(zcoef=zcoef, maxorder=12)

X11()

# show again with some tilt
iwf <- synth.interferogram(zcoef=zcoef, maxorder=12, addzc=c(0,5,5,0))
```

---

turbwf	<i>Kolmogorov Turbulence</i>
--------	------------------------------

---

**Description**

Simulates the optical effects of atmospheric turbulence using Noll's (1976) calculation of the covariance matrix of Zernike polynomials under Kolmogorov turbulence.

**Usage**

```
turbwf(friedratio = 1, zlist = makezlist(2, 40), reps = 1)
```

**Arguments**

friedratio	Ratio of pupil diameter to Fried parameter
zlist	A list of Zernikes, as returned for example by <a href="#">makezlist</a>
reps	Number of draws to simulate

**Details**

The default value of zlist has 440 elements, which may be more than necessary for a reasonable representation of an “atmospheric” wavefront.

**Value**

A list with the following components:

zcoef.turb	A reps x length(zlist\$n matrix of simulated draws of Zernike coefficients.
V	Covariance matrix of the indexed Zernikes.

**Note**

Typos in the original source material have been corrected in the code. Note that scintillation is not modelled.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**References**

Noll, R.J. 1976, **Zernike polynomials and atmospheric turbulence**, *J. Opt. Soc. Am.*, Vol. 66, No. 3, p. 207.

**See Also**

[Zernike](#), [pupil](#).

**Examples**

```
# Simulate a single draw from a turbulent atmosphere
zcoef.turb <- turbwf(friedratio=5, zlist=makezlist(2,30), reps=1)$zcoef.turb
# Warning: this can take a while
wf <- pupil(zcoef=zcoef.turb, zlist=makezlist(2,30))
plot(wf)
summary(wf)
```

---

vortexfit

*Vortex transform.*

---

**Description**

Fringe analysis by Vortex aka Spiral Quadrature transform.

**Usage**

```
vortexfit(
  imagedata,
  cp = NULL,
  filter = NULL,
  fw.o = 10,
  options = psfit_options()
)
```

**Arguments**

imagedata	matrix containing the interferogram data
cp	list with circle parameters describing interferogram location. Defaults to NULL
filter	size of filter to remove background
fw.o	size of gaussian blur to smooth orientation estimate
options	A list with general fitting and display options. See <code>psfit_options()</code> .

**Details**

Implements the Vortex or spiral phase quadrature transform method of Larkin et al. (2001) <https://doi.org/10.1364/JOSAA.18> including the fringe orientation estimation approach in Larkin (2005) <https://doi.org/10.1364/OPEX.13.008097>. Thanks to Steve Koehler for ideas on implementation details.

**Value**

a list with wavefront estimates, wrapped phase, modulation, etc.

**Warning**

This routine is offered as is with no license, as it may be in violation of one or more US and international patents.

**See Also**

This is one of two routines provided for analysis of single interferograms, along with `fftfit()`. This *may* be suitable for interferograms with closed fringes.

**Examples**

```
require(zernike)
fpath <- file.path(find.package(package="zernike"), "psidata")
fname <- "Image197.jpg"
img <- load.images(file.path(fpath, fname))

# parameters for this run

source(file.path(fpath, "parameters.txt"))

# target SA coefficients for numerical null.

sa.t <- sconic(diam,roc,lambda=wavelength)
zopt <- psfit_options()
zopt$satarget <- sa.t

# display an interferogram

if (tolower(.Platform$OS.type) == "windows") windows() else x11()
image(1:nrow(img), 1:ncol(img), img, col=grey256, asp=1,
      xlab="X", ylab="Y", useRaster=TRUE)
mtext("Sample Interferogram")
```

```
if (tolower(.Platform$OS.type) == "windows") windows() else x11()
vfit <- vortexfit(img, filter=15, fw.o=10, options=zopt)
```

wf3d.pupil

*OpenGL wavefront plot*

## Description

Interactive plot of a wavefront using the OpenGL package **rgl**. This is a 3D plotting method for objects of class "[pupil](#)".

## Usage

```
wf3d.pupil(wf, cp=NULL, zoom.wf = 1, surf.col = topo.colors(256), bg.col = "black",
  eqa=FALSE, new.window=TRUE)
```

## Arguments

wf	A matrix of wavefront values
cp	A list describing the pupil boundary
zoom.wf	Zoom factor for heights
surf.col	Color palette for surface
bg.col	Background color
eqa	Equal area per color?
new.window	If TRUE (the default), open a new rgl deice. Otherwise clears and re-uses an existing window if available

## Details

The default color palette will match the colors in the default version of [plot.pupil](#).

## Value

none

## Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

## References

The **rgl** package is available from CRAN.

## See Also

[plot.pupil](#)

## Examples

```
# create a random wavefront

wf <- pupil(zcoef=rnorm(length(makezlist())$n), mean=0, sd=0.01))
# the default method

plot(wf)

#this is more fun

wf3d(wf)
```

---

wf_net	<i>Wavefront smoothing</i>
--------	----------------------------

---

## Description

Calculate net and smoothed wavefronts from a raw wavefront containing low order nuisance aberrations.

## Usage

```
wf_net(wf.raw, cp, options)
```

## Arguments

wf.raw	Raw wavefront to be processed
cp	a list describing the pupil boundary
options	a list of options. See <a href="#">psfit_options</a>

## Details

Called by [psifit](#)

## Value

A list with the following components:

wf.net	Net unsmoothed wavefront; a matrix of class " <a href="#">pupil</a> "
wf.smooth	Net smoothed wavefront
wf.residual	Difference between net wavefront and polynomial fit
fit	Return value from <a href="#">fitzernikes</a>
zcoef.net	Net Zernike coefficients from fit

**Note**

As of ver. 3.7.2 the values of `options$isoseq` and `cp$obstruct` determine what is called to fit Zernikes. If `isoseq` is TRUE it's either `zpm_cart` or `zapm_cart`, with the latter called automatically if `cp$obstruct > 0`. Otherwise the calls are made to `zpm` or `zapmC`.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**Examples**

```
## illustrates effect of incremental addition of an obstruction
## and standalone use of wf_net

---

zapm

*Zernike Annular polynomials*

---

## Description

Create a matrix of Zernike Annular polynomial values in extended Fringe sequence for a set of polar coordinates.

## Usage

```
zapm(rho, theta, eps, maxorder = 12L, nq = maxorder/2L + 5L)
```

## Arguments

rho	a vector of radial coordinates with $\text{eps} \leq \text{rho} \leq 1$ .
theta	a vector of angular coordinates, in radians.
eps	the obstruction fraction $0 \leq \text{eps} < 1$ .
maxorder	the maximum radial polynomial order (defaults to 12).
nq	the number of quadrature points for numerical integration

## Details

The *radial* polynomials are calculated using recurrence relations generated numerically using chebyshev's algorithm with modified moments. See the documentation for `rzernike_ann()`. A formal presentation is included in the package documentation.

## Value

a matrix of Zernike Annular polynomial values evaluated at the input polar coordinates and all radial orders from 0 through maxorder in Fringe sequence, with orthonormal scaling.

## Examples

```
sample_az <- function(maxorder=12, eps=0.33, col=rev(zernike::rygcb(400)), addContours=TRUE, cscale=TRUE) {

  ## get coordinates for unobstructed and obstructed apertures
  cpa <- cp.default
  cpa$obstruct <- eps
  prt <- pupil.rhotheta(nrow.default,ncol.default,cp.default)
  prta <- pupil.rhotheta(nrow.default,ncol.default,cp=cpa)
  rho0 <- prt$rho[!is.na(prt$rho)]
  theta0 <- prt$theta[!is.na(prt$theta)]
  rhoa <- prta$rho[!is.na(prta$rho)]
  thetaa <- prta$theta[!is.na(prta$theta)]

  ## fill up matrixes of Zernikes and Annular Zernikes

  zm <- zpmC(rho0, theta0, maxorder=maxorder)
  zam <- zapm(rhoa, thetaa, eps=eps, maxorder=maxorder, nq=maxorder/2+5)

  ## pick a column at random and look up its index pair

  zlist <- makezlist(0, maxorder)
  i <- sample(2:ncol(zm), 1)
  n <- zlist$n[i]
  m <- zlist$m[i]

  ## fill up the wavefront representations and plot them

  wf0 <- prt$rho
  wf0[!is.na(wf0)] <- zm[,i]
  class(wf0) <- "pupil"

  wfa <- prta$rho
  wfa[!is.na(wfa)] <- zam[,i]
  class(wfa) <- "pupil"

  plot(wf0, cp=cp.default, col=col, addContours=addContours, cscale=cscale)
  mtext(paste("Zernike, n =", n, " m =", m))

  x11()
  plot(wfa, cp=cpa, col=col, addContours=addContours, cscale=cscale)
  mtext(paste("Annular Zernike, n =", n, " m =", m))
}
```

```

    ## return Zernike matrices and wavefronts invisibly
    ## just in case user wants to do something with them

    invisible(list(zm=zm, wf0=wf0, zam=zam, wfa=wfa))
  }

  sample_az()

```

---

zapm\_128

*Zernike Annular polynomials, extended precision version*

---

## Description

Create a matrix of Zernike Annular polynomial values in extended Fringe sequence for a set of polar coordinates.

## Usage

```
zapm_128(rho, theta, eps, maxorder = 12L, nq = maxorder/2L + 5L)
```

## Arguments

rho	a vector of radial coordinates with $\text{eps} \leq \text{rho} \leq 1$ .
theta	a vector of angular coordinates, in radians.
eps	the obstruction fraction $0 \leq \text{eps} < 1$ .
maxorder	the maximum radial polynomial order (defaults to 12).
nq	the number of quadrature points for numerical integration

## Details

The *radial* polynomials are calculated using recurrence relations generated numerically using chebyshev's algorithm with modified moments. See the documentation for [rzernike\\_ann\(\)](#). A formal presentation is included in the package documentation.

## Value

a matrix of Zernike Annular polynomial values evaluated at the input polar coordinates and all radial orders from 0 through maxorder in Fringe sequence, with orthonormal scaling.

## Examples

```

sample_az_128 <- function(maxorder=12, eps=0.33, col=rev(zernike::rygcb(400)), addContours=TRUE, cscale=TRUE) {

  ## get coordinates for unobstructed and obstructed apertures
  cpa <- cp.default
  cpa$obstruct <- eps
  prt <- pupil.rhotheta(nrow.default,ncol.default,cp.default)
  prta <- pupil.rhotheta(nrow.default,ncol.default,cp=cpa)

  theta0 <- prt$theta[!is.na(prt$theta)]
  rhoa <- prta$rho[!is.na(prta$rho)]
  thetaa <- prta$theta[!is.na(prta$theta)]

  ## fill up matrixes of Zernikes and Annular Zernikes

  zm <- zpmC(rho0, theta0, maxorder=maxorder)
  zam <- zapm_128(rhoa, thetaa, eps=eps, maxorder=maxorder, nq=maxorder/2+5)

  ## pick a column at random and look up its index pair

  zlist <- makezlist(0, maxorder)
  i <- sample(2:ncol(zm), 1)
  n <- zlist$n[i]
  m <- zlist$m[i]

  ## fill up the wavefront representations and plot them

  wf0 <- prt$rho
  wf0[!is.na(wf0)] <- zm[,i]
  class(wf0) <- "pupil"

  wfa <- prta$rho
  wfa[!is.na(wfa)] <- zam[,i]
  class(wfa) <- "pupil"

  plot(wf0, cp=cp.default, col=col, addContours=addContours, cscale=cscale)
  mtext(paste("Zernike, n =", n, " m =", m))

  x11()
  plot(wfa, cp=cpa, col=col, addContours=addContours, cscale=cscale)
  mtext(paste("Annular Zernike, n =", n, " m =", m))

  ## return Zernike matrices and wavefronts invisibly
  ## just in case user wants to do something with them

  invisible(list(zm=zm, wf0=wf0, zam=zam, wfa=wfa))
}

sample_az_128()

```

---

zapm\_direct

*Zernike Annular polynomials from formulas*

---

**Description**

Create a matrix of Zernike Annular polynomial values for the counterparts of primary and secondary optical aberrations.

**Usage**

```
zapm_direct(rho, theta, eps)
```

**Arguments**

rho            a vector of radial coordinates with  $\text{eps} \leq \text{rho} \leq 1$ .  
theta          a vector of angular coordinates, in radians.  
eps            the obstruction fraction  $0 \leq \text{eps} < 1$ .

**Details**

The values are from published formulas. This function is included for testing and reference only.

**Value**

a  $\text{length}(\text{rho}) \times 16$  matrix of Zernike annular polynomial values.

**See Also**

Calls [rzernike\\_ann\\_direct\(\)](#) for radial Zernike annular values. Use [zapm\(\)](#) or [zapm\\_128\(\)](#) for complete sequences of values to arbitrary order.

---

zapm\_iso

*Zernike Annular polynomials, ISO ordering*

---

**Description**

Create a matrix of Zernike Annular polynomial values in ISO/ANSI sequence for a set of polar coordinates.

**Usage**

```
zapm_iso(rho, theta, eps, maxorder = 12L, nq = maxorder/2L + 5L)
```

## Arguments

rho	a vector of radial coordinates with $\text{eps} \leq \text{rho} \leq 1$ .
theta	a vector of angular coordinates, in radians.
eps	the obstruction fraction $0 \leq \text{eps} < 1$ .
maxorder	the maximum radial and azimuthal polynomial order (defaults to 12).
nq	the number of quadrature points for numerical integration

## Details

The *radial* polynomials are calculated using recurrence relations generated numerically using chebyshev's algorithm with modified moments. See the documentation for [rzernike\\_ann\(\)](#). A formal presentation is included in the package documentation.

## Value

a matrix of Zernike Annular polynomial values evaluated at the input polar coordinates and all radial orders from 0 through maxorder in ISO/ANSI sequence, with orthonormal scaling.

## Examples

```
sample_az_iso <- function(maxorder=12, eps=0.33, col=rev(zernike::rygcb(400)), addContours=TRUE, cscale=TRUE) {

  ## get coordinates for unobstructed and obstructed apertures
  cpa <- cp.default

```

---

zapm_iso_direct	<i>Zernike Annular polynomials from formulas</i>
-----------------	--

---

## Description

Create a matrix of Zernike Annular polynomial values complete through radial and azimuthal orders 6 in ISO/ANSI sequence.

## Usage

```
zapm_iso_direct(rho, theta, eps)
```

## Arguments

rho	a vector of radial coordinates with $\text{eps} \leq \text{rho} \leq 1$ .
theta	a vector of angular coordinates, in radians.
eps	the obstruction fraction $0 \leq \text{eps} < 1$ .

## Details

The values are from published formulas. This function is included for testing and reference only.

## Value

a  $\text{length}(\text{rho}) \times 28$  matrix of Zernike annular polynomial values.

## See Also

Calls [rzernike\\_ann\\_direct\(\)](#) for radial Zernike annular values. Use [zapm\\_iso\(\)](#) or [zapm\\_iso\\_128\(\)](#) for complete sequences of values to arbitrary order.

## Examples

sample_az_iso_direct()

```

---

zconic

*Zernike coefficients for a conic surface*

---

## Description

Calculates the radially symmetric Zernike coefficient values up to order nmax for a conic surface relative to a sphere of the same paraxial radius of curvature.

**Usage**

```
zconic(D, rc, b = -1, lambda = 1e-06, nmax = 6)
```

**Arguments**

D	Diameter
rc	Radius of curvature
b	Conic constant
lambda	Wavelength – defaults to 632.8 (nm)
nmax	Maximum radial polynomial order. Defaults to 6.

**Details**

For the typical use case D and rc should be in millimeters and lambda in nanometers.

**Value**

A vector of length  $nmax/2-1$  of coefficient values, in increasing radial order,  $n=c(4,6, \dots)$ .

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

**See Also**

[Zernike](#), [sconic](#)

**Examples**

```
zconic(200,2000)
zconic(10, 20, b=-1.05, lambda=632.8E-9, nmax=12)
```

---

Zernike

*Zernike Polynomials*

---

**Description**

Routines for creating and manipulating Zernike polynomials.

**Usage**

```
Zernike(rho, theta, n, m, t)
rzernike(rho, n, m)
drzernike(rho, n, m)
```

**Arguments**

rho	normalized radius, $0 \leq \rho \leq 1$
theta	angular coordinate
n	radial polynomial order
m	azimuthal order
t	character for trig function: one of c("n", "c", "s")

**Note**

These functions return Zernikes scaled such that they form an orthonormal basis set for the space of functions defined on the unit circle. Note that this is not the most commonly used definition (as given e.g. in *Born and Wolf*). The definition I use is often associated with *Noll (1976)*.

The function `zmult` can be used to convert between normalized and conventionally defined vectors of Zernike coefficients.

The basic low level functions `rzernike` and `drzernike` use numerically stable recurrence relationships for the radial Zernikes.

**Examples**

```
Zernike(1, 0, 4, 0, "n") # == sqrt(5)

# A slightly more complex example

rho <- seq(0, 1, length = 101)
theta <- rep(0, 101)

plot(rho, Zernike(rho, theta, 6, 0, "n"), type="l",
     ylim=c(-3.5,3.5), main="Some 6th order Zernike Polynomials")
lines(rho, Zernike(rho, theta, 5, 1, "c"), lty=2)
lines(rho, Zernike(rho, theta, 4, 2, "c"), lty=3)
lines(rho, Zernike(rho, theta, 3, 3, "c"), lty=4)
```

---

zlist

---

*Lists of Zernike polynomial indexes*

---

**Description**

Ordered lists of Zernike polynomial indexes.

**Usage**

```
makezlist(minorder = 2, maxorder = 14)
zlist.fr
zmult(zlist = makezlist())
```

**Arguments**

minorder	minimum value of $n+m$
maxorder	maximum value of $n+m$
zlist	a list of the form returned by makezlist

**Details**

Zernike polynomials are indexed by a radial index  $n$ , an azimuthal index  $m$ , and include cosine, sine, and radial terms. These routines return lists of indexes using a popular ordering scheme for Zernike polynomials.

**Value**

makezlist and zlist.fr return lists with the following components:

n	radial order
m	azimuthal order
t	one of c("c", "s", "n")

zmult returns a vector the same length as the components of zlist.

**Note**

zlist.fr is an augmented “Fringe” set of Zernike polynomials equivalent to makezlist(2,12).

makezlist returns a complete list of indexes for all orders from minorder through maxorder, where “order” is the value of  $n+m$ .

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

See Also

Virtually all high level functions that work with Zernike polynomials use these lists. See for example [pupil](#), [psifit](#), [fftfit](#).

Examples

```
zlist <- makezlist(2,12)
zcoef <- rnorm(length(zlist))
zcoef # a vector of normalized Zernike coefficients
zcoef*zmult(zlist) # Coefficients in conventional representation
sqrt(crossprod(zcoef)) # This is the RMS error of the wavefront
# constructed from these Zernikes
```

---

zmoments	<i>Zernike moments</i>
----------	------------------------

---

Description

Calculate Zernike moments from a vector of coefficients

Usage

```
zmoments(zcoef, maxorder = 14)
```

Arguments

zcoef	Zernike coefficients
maxorder	Maximum order to return

Value

A table of the moments along with radial and azimuthal orders

References

M.L. Peck

zpm

*Matrixes of Zernike polynomials***Description**

Create a matrix of Zernike polynomial values.

**Usage**

```
zpm(rho, theta, phi= 0 , maxorder = 14, nthreads=parallel::detectCores()/2)
zpmC(rho, theta, maxorder)
zpmCP(rho, theta, maxorder)
zpm.arb(rho, theta, phi = 0, zlist = makezlist())
```

**Arguments**

rho	A vector of radial coordinates.
theta	A vector of angular coordinates, in radians.
phi	Orientation of the image, in degrees
zlist	A list of indexes, as returned by <a href="#">makezlist</a>
maxorder	The maximum Zernike polynomial order
nthreads	Number of threads for threaded function call

**Details**

rho and theta must be the same length.

**Value**

zpm.arb returns a matrix of size  $\text{length}(\text{rho}) \times \text{length}(\text{zlist}\$n)$  with values of Zernike polynomials evaluated at the polar coordinates (rho,  $\text{theta} - \pi \cdot \text{phi} / 180$ ).

zpm, zpmC, and zpmCP return a matrix of size  $\text{length}(\text{rho}) \times (\text{maxorder}/2+1)^2$  of Zernike polynomial values including a piston term.

**Note**

These are used by various routines to make least squares fits of sets of Zernike polynomials to measured wavefront values.

zpmC is the C++ routine that does the computations for zpm. No column names are returned.

Threaded computation of the matrix is now available using zpmCP.

**Author(s)**

M.L. Peck <mpeck1@ix.netcom.com>

---

zpm\_cart

*Zernike polynomials*

---

**Description**

Calculate Zernike polynomial values in ISO/ANSI sequence for a set of Cartesian coordinates.

**Usage**

```
zpm_cart(x, y, maxorder = 12L, unit_variance = TRUE)
```

**Arguments**

**x** a vector of x coordinates for points on a unit disk.  
**y** a vector of y coordinates.  
**maxorder** the maximum radial polynomial order (defaults to 12).  
**unit\_variance** logical: return with orthonormal scaling? (default true)

**Details**

This is the same algorithm and essentially the same code as [gradzpm\\_cart\(\)](#) except directional derivatives aren't calculated.

**Value**

a matrix of Zernike polynomial values evaluated at the input Cartesian coordinates and all radial and azimuthal orders from 0 through maxorder.

**Examples**

```
##illustrates difference in smoothed wavefront from using zpm_cart with ISO sequence of same order

require(zernike)
fpath <- file.path(find.package(package="zernike"), "psidata")
files <- scan(file.path(fpath, "files.txt"), what="character")
for (i in 1:length(files)) files[i] <- file.path(fpath, files[i])

## load the images into an array

images <- load.images(files)

## parameters for this run

source(file.path(fpath, "parameters.txt"))
```

```
## phase shifts

phases <- wrap((0:(dim(images)[3]-1))/frames.per.cycle*2*pi)
phases <- switch(ps.dir, ccw = -phases, cw = phases, phases)

## target SA coefficients for numerical null.

sa.t <- sconic(diam,roc,lambda=wavelength)
zopt <- psfit_options()
zopt$satarget <- sa.t
psfit <- psifit(images, phases, psialg="ls", options=zopt)

## get back the raw wavefront

wf.raw <- qpuw(psfit$phi, psfit$mod)

## This will tell wf_net to use zpm_cart instead

zopt$isoseq <- TRUE
ifit <- wf_net(wf.raw, cp = psfit$cp, options=zopt)

## plotn does a direct comparison

plotn(psfit, ifit, wftype="smooth", qt=c(0,1))
```
